

Were you able to navigate around the page?	Evaluates the clarity of navigation elements and whether the layout is intuitive for users unfamiliar with digital interfaces.
Was your name clear?	Verifies if personalisation features (e.g. greeting the user) are working properly and clearly visible.
Was today's data clear?	Tests whether key UI elements—like dates, logs, and content—are readable and well formatted.
On your food diary were you able to view your food intake?	Assesses whether users can understand and interact with their nutrition logs, a core functional area.
Was the calories, carbs, fat and sugar value of your food displayed?	Ensures nutritional data is accurately and clearly presented for informed user decisions.
Were you able to access the two available videos?	Checks accessibility and playback of embedded video content, including user perception of variety and control.
Were you able to access my fitness training page?	Validates if users can reach key sections such as workout resources independently.
Were you able to add a type of exercise from the drop-down list?	Tests the usability of interactive form components and content breadth in exercise options.
Was the output of the exercise calculated and clearly displayed?	Confirms whether exercise-related data calculations (e.g. calories burned) are correct and easy to interpret.
Was the output of the weight exercise calculated and clearly displayed?	Specifically checks if weight-related exercises give immediate, clear feedback to support user goal tracking.
Was the weight difference displayed if you were under your target?	Evaluates feedback systems that inform the user about progress or areas needing improvement.
Were you able to access my reports page?	Assesses discoverability of summary information and personalised data reporting.
Was your report clearly displayed on the screen for today?	Ensures the report output is correctly formatted and easy to read for a non-technical audience.
Were you able to access a blog and make a post?	Tests interactivity features and encourages content creation or engagement in the community space.
Overall were you able to navigate around the system and select the different options?	Provides an overall gauge of system usability and accessibility across the interface.

HM Government

Were you able to change the settings to make the text bigger?

Checks accessibility customisations that support users with visual impairments or preferences.

Could you use the website on the computer, and did you have any problems?

Gathers feedback on device compatibility and any general usability concerns experienced during normal use.

Example of form

* Required

1. What's your name? *

Enter your answer

2. Did the prototype allow you to sign in? * ☐

☐ Yes

☐ No

3. Did you get a confirmation email? * ☐

☐ Yes

☐ No

4. Did the prototype allow you to login? * ☐

☐ Yes

☐ No

5. Were you able to navigate around the page? * ☐

☐ Yes

☐ No

6. Was your name clear? * ☐

☐ Yes

☐ No

Questionnaire for the technical user

Question	Rationale
What's your name?	Identifies the tester for follow-up or clarification and supports tracking of feedback from multiple reviewers.
Did the login system behave as expected when tested with valid and invalid inputs?	Verifies whether authentication is functioning as intended and includes proper error-handling.
Were password errors clearly handled and communicated?	Assesses whether error messages are clear, secure, and user-friendly, reducing confusion and improving UX.
Was the form input validation appropriate for email and password fields?	Ensures front-end validation is present to prevent invalid or malicious inputs reaching the server.
Was user data submitted securely?	Evaluates whether data is being transmitted over secure methods (e.g. POST, HTTPS) to protect user privacy.
Was the backend logic consistent and predictable?	Checks that server responses are reliable and correctly process requests across typical and edge use cases.
Were the dropdown lists populated dynamically or hardcoded?	Identifies whether the UI is scalable and user-driven, or reliant on static data which may be harder to maintain.
Was there evidence of input sanitisation on user-submitted content?	Ensures defences are in place against script injection and other common attack vectors.
Were you able to trigger any unexpected errors or crashes?	Assesses robustness and error handling, helping detect instability or unhandled edge cases.
Were cookies or sessions used appropriately for user state?	Confirms secure session handling and correct post-login persistence of user state.
Was the codebase modular and easy to follow?	Determines how maintainable and readable the code is, especially in terms of logic separation and reuse.
Were the output calculations (e.g. exercise totals) consistently correct?	Validates that logic such as totals or metrics is functioning accurately across inputs.
Did the calorie/food data update live or require refresh?	Assesses whether a modern UX pattern (AJAX/live updates) is in place, or if the site requires full refreshes.

Was the accessibility toggle implemented using standard methods?	Verifies if accessibility features (e.g. font resizing) follow best practices for wider usability.
Was the API or external service use clearly handled?	Confirms that integration with services like YouTube or payment systems is implemented and behaves predictably.
Was the site responsive on different devices or screen sizes?	Ensures cross-device compatibility for users accessing via desktop, tablet or mobile.
Were there any broken links, missing content or incomplete features?	Identifies any unfinished or malfunctioning areas within the user journey or structure.
Were database interactions appropriately secure (e.g. prepared statements)?	Assesses backend data protection against common vulnerabilities like SQL injection.
Was there evidence of AI-generated code in use?	Evaluates how AI-generated content is integrated, and whether it maintains structural integrity or introduces risk.
Would the prototype support further development and scaling?	Determines if the technical foundation is reusable and flexible for continued feature development.
Any additional feedback?	Provides an open-ended field for suggestions or comments not captured in the structured evaluation.

1	Did the prototype allow you to sign in?	Did you get a confirmation email?	Did the prototype allow you to login?	Were you able to navigate around the page?	Was your name clear?
2	Yes, it was easy	Yes, looked fine	Yep, logged in fine	Yes, the links were fine	Yeah, showed up on screen
3	Yes, it was easy	Yes, looked fine	Yes, worked as expected	Yes, everything worked	Yes, no spelling issues
4	Yes, simple enough	Yes, but didn't really say much	Yes, no issues	Pretty easy to get around	Yes, no spelling issues
5	Took a second but worked	Yes, looked fine	Yep, logged in fine	Pretty easy to get around	Yes
6	Yes, no problems	Yes	Yes, no issues	Yes, the links were fine	Yeah, showed up on screen
7	Took a second but worked	Didn't check	Yes, no issues	Pretty easy to get around	It was there
8	Yes, it was easy	Yes	Yep, logged in fine	Pretty easy to get around	Yes, no spelling issues
9	Took a second but worked	Yes, looked fine	Yes, worked as expected	Yes, the links were fine	It was there
10	Took a second but worked	Yes, looked fine	Yep, logged in fine	Yes, the links were fine	Yeah, showed up on screen
11	Yes, it was easy	Yes, looked fine	Yes, worked as expected	Yes, no trouble	It was there

Technical users

1	What's your name?	Did the login system behave as expected when tested with valid and invalid inputs?	Were password errors clearly handled and communicated?	Was the form input validation appropriate for email and password?	Was user data submitted securely?
2	Alex	No, invalid inputs sometimes passed	No, not very helpful messages	Yes, strict validation applied	Submitted with POST, HTTPS recommended
3	Jordan	Mostly yes, a few edge cases failed	Somewhat clear, could be more specific	Yes, strict validation applied	Submitted with POST, HTTPS recommended
4	Sam	Mostly yes, a few edge cases failed	Yes, error messages appeared as expected	Yes, strict validation applied	Yes, HTTPS and POST were used
5	Taylor	No, invalid inputs sometimes passed	Yes, error messages appeared as expected	Validation was missing for email field	Yes, HTTPS and POST were used
6	Morgan	Mostly yes, a few edge cases failed	Yes, error messages appeared as expected	Yes, strict validation applied	Yes, HTTPS and POST were used
7	Casey	Mostly yes, a few edge cases failed	Somewhat clear, could be more specific	Yes, both client and server validation	Not sure if needs backend check
8	Jamie	Yes, handled both valid and invalid inputs well	Somewhat clear, could be more specific	Yes, both client and server validation	Data went through, but no encryption seen
9	Avery	Yes, validation worked correctly	No, not very helpful messages	Validation was missing for email field	Submitted with POST, HTTPS recommended
10	Riley	Yes, validation worked correctly	No, not very helpful messages	Yes, both client and server validation	Yes, HTTPS and POST were used
11	Quinn	No, invalid inputs sometimes passed	Yes, the messages were shown	Only client-side validation was used	Data went through, but no encryption seen

2. Observation

I asked three non-technical users to review the prototype in order to get clear observations of how they interacted with the prototype. Observing users, while giving less structured feedback, can give more qualitative understanding of the prototype performance. While they were using the prototype, I asked them to interact with the main features and I asked them to consider the following points and to share their thoughts:

- what the prototype did well
- how it could be developed further.

Observation 1

The user began on the login screen and spent around 10 seconds looking over the page before entering their details. They typed in their email and password correctly on the first attempt but hesitated slightly before clicking the login button, possibly due to uncertainty over whether the form had registered their inputs. Once logged in, they commented positively on the welcome message that used their name, stating, "That's a nice touch. It makes it feel more personal."

After logging in, the user initially appeared confused by the layout. They hovered over several non-clickable areas before eventually clicking on the sidebar to reveal the navigation. They said aloud, "I didn't realise that was a menu at first – maybe it needs to stand out more." Once they accessed the food diary, they found it easy to use. They added a basic food item and adjusted the portion size with no issue. However, they noted that the nutrition values weren't obvious straight away, adding, "It's good that it's all here, but I wouldn't have noticed the fat and sugar numbers if I wasn't looking carefully."

The user then returned to the homepage and commented that the orange buttons were easy to spot and made it obvious where to go next. They didn't require any assistance overall but suggested a clearer label on the menu and perhaps a small tutorial the first time someone logs in. In general, they were able to use all the intended functions, but some parts of the interface were not immediately obvious to them until they explored further.

Observation 2

This user began confidently and completed the sign-in process without any issues. They commented that the site looked clean and "not too busy," which helped them feel comfortable exploring it. Their first task was to watch one of the embedded workout videos. They scrolled through the homepage and stopped at the video section but continued scrolling without interacting. A few seconds later, they scrolled back up, appearing unsure. When prompted to explain what they were looking for, they said, "I didn't even see that was a video

Task 3 – Activity A – Commentary

The gathering of feedback demonstrates an effective use of tools and technologies to work collaboratively and increase efficiency while demonstrating an effective process for discovering relevant information.

Effectiveness of materials to support the feedback process

The work makes effective use of a range of materials, including tailored questionnaires, structured observations and response charts, which together allow for the gathering of high-quality feedback from different aspects of the prototype. The selection of materials demonstrates awareness of both technical and non-technical requirements, with clear attempts to ensure accessibility and consistency.

To improve, the work could:

- strengthen the analysis of questionnaire data to show clearer patterns and trends across user groups
- reduce duplication between technical and non-technical questionnaires
- link observation notes more explicitly to specific design requirements to ensure the feedback directly informs iteration
- use screencasts to be able to collect more data within the available time.

Use of appropriate feedback tools to support the gathering of effective feedback

The work applies a range of effective feedback tools that generate evidence-informed opportunities for further iteration. Questionnaires provide structured feedback, and observation captures qualitative insights into user experience. The tools are suitable and mostly reliable in producing feedback that supports refinement of the prototype.

To improve, the work could:

- introduce a more systematic approach to observation, such as structured grids, to make comparisons across users more consistent
- integrate paired coding review records to identify efficiency, commenting quality and maintainability issues

**Effectiveness of communication**

Communication is effective for both technical and non-technical audiences using dully appropriate techniques, methods and formats. The separation of questionnaires for each group demonstrates awareness of audience needs, and the use of charts and spreadsheets supports clarity in presenting results. Technical terminology is used appropriately and is supported with accessible formatting.

To improve, the work could:

- provide clearer explanatory notes alongside charts and tables so findings are fully understandable without further interpretation
- simplify specialist terminology for non-technical audiences while retaining technical precision for experts
- add short definitions or examples where technical language may be less familiar to some audiences.

at first. I thought it was just an image.”

Once they realised it was playable, they clicked it, and it launched as expected. They watched for a few seconds, tested full-screen mode, then exited. Afterward, they mentioned that the play icon wasn’t as visible as they expected, particularly on mobile where the preview size was smaller. They suggested that the videos could use a clearer overlay or label saying “Click to play.”

The user moved on to the blog section but appeared unsure about where to go to add a comment. They eventually clicked into a post and found the comment box at the bottom but suggested it could be brought higher up the page to encourage more interaction. When looking for accessibility settings, they spent some time in the profile area before finding the option to increase text size. Once located, they said, “That’s better. I just wish it was on the main page or easier to get to.”

The user completed all tasks without technical problems, but they relied on visual cues and found subtle icons or controls difficult to notice without guidance. Overall, they said the platform felt professional and would be “really helpful once you know where everything is.”

Observation 3

This user started by logging into the prototype and mentioned they appreciated how quick the site loaded and that the orange buttons made it clear what to click on. Their first destination was the food diary, which they found by clicking around the dashboard before locating the correct tab in the sidebar. They commented, “There’s a lot of good stuff here, but it took me a while to figure out what everything did.”

They added several food items and adjusted quantities using the input fields. This process went smoothly, and they remarked that the form was easy to use. However, they paused after submitting the entries, seemingly unsure whether anything had changed. The nutrition summary did update, but the change was subtle. When asked if they saw the result, they responded, “Oh, I guess it did update – it could be a bit more obvious.”

The user also visited the reports page and commented that the graph showing their progress looked “really motivating.” However, they were confused by one of the labels and asked what “Active Minutes” meant, suggesting that tooltips or small info icons could help less experienced users understand what each metric refers to.

When asked about accessibility, they said the text was generally easy to read, but they might struggle on a smaller screen. They didn’t notice the text size adjustment option until it was pointed out. They concluded by saying the site was “simple once you know your way around,” and suggested that a “first-time

user tour” might make a big difference.

In summary, the user engaged well with the food diary and tracking features, but their experience highlighted a need for clearer visual feedback and small explanations throughout the interface to help new users understand what they’re seeing.
