

Task 3 – Activity A – Example Student Response (Distinction level)

Feedback materials and records

I wanted to gather feedback in different ways including getting detailed feedback through:

1. a questionnaire from technical and non-technical users
2. observe potential users interacting with the prototype and get direct feedback from them.

Together, these would give me a useful indication on the performance of the prototype.

1. Questionnaire for technical and non-technical users

To gather structured feedback, I used Microsoft Forms to create two separate digital questionnaires, one for technical users and one for non-technical users. This allowed me to tailor the language and content of each form to suit the intended audience. Once responses were submitted, I downloaded the data as an Excel spreadsheet for analysis. This made it easier to compare answers across users, identify patterns, and organise the feedback alongside my observation notes. Using Microsoft Forms also helped ensure accessibility and consistency in how the questions were presented, and the spreadsheet export provided a clear, editable format for later evaluation.

Questionnaire for the non-technical user

Question	Rationale
What's your name?	Establishes participant identity and helps link feedback to individual user profiles or demographics.
Did the prototype allow you to sign in?	Checks whether the most basic access point (sign-in) is functional and intuitive for users without technical expertise.
Did you get a confirmation email?	Ensures users receive essential onboarding communication and allows testing of back-end messaging systems.
Did the prototype allow you to login?	Confirms whether the login functionality is working correctly and is usable by non-technical users.

clarity could be gained by mapping the source log directly to specific components within the prototype.

Change log

There are detailed records that are clear, structured, and consistently formatted, demonstrating an effective approach to development using accepted conventions. This shows an understanding of factors that inform changes to software and their associated implications. However, the documentation would benefit from showing the before and after code to demonstrate the changes that were made.
